

# Collated Kanban

02.03.2023

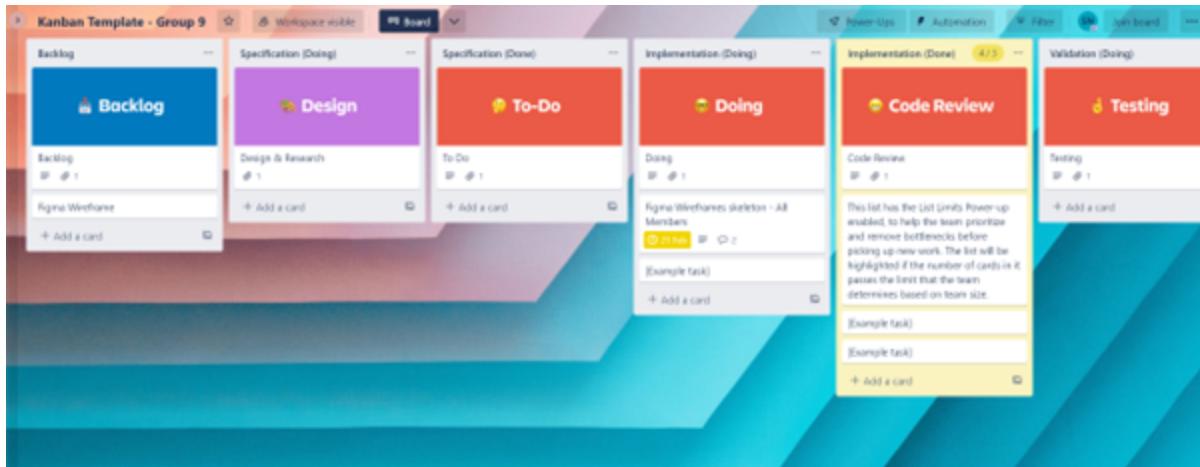

BleedGreen

## Overview

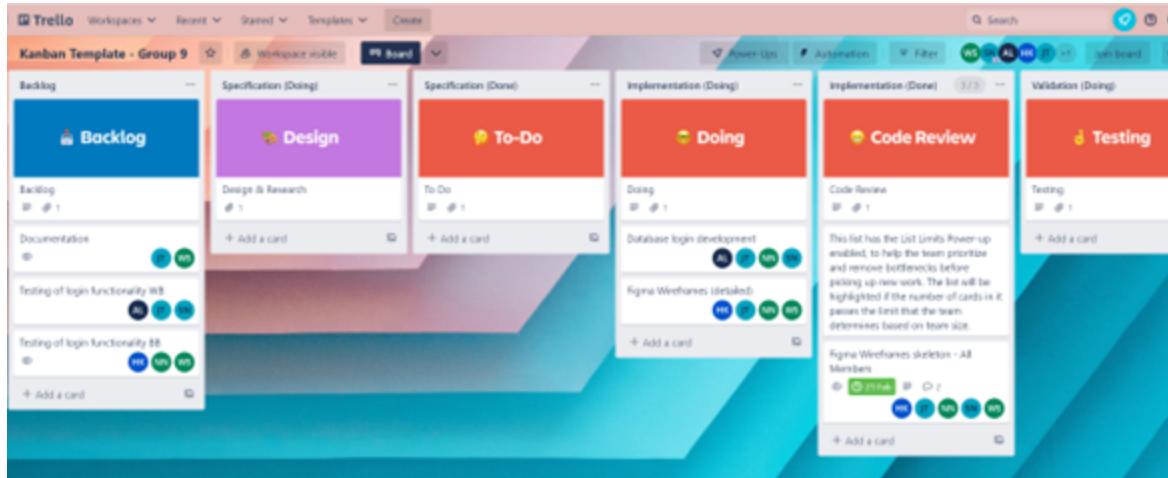

The following document has the collated kanban snapshots that show our development timeline & progress.

160223

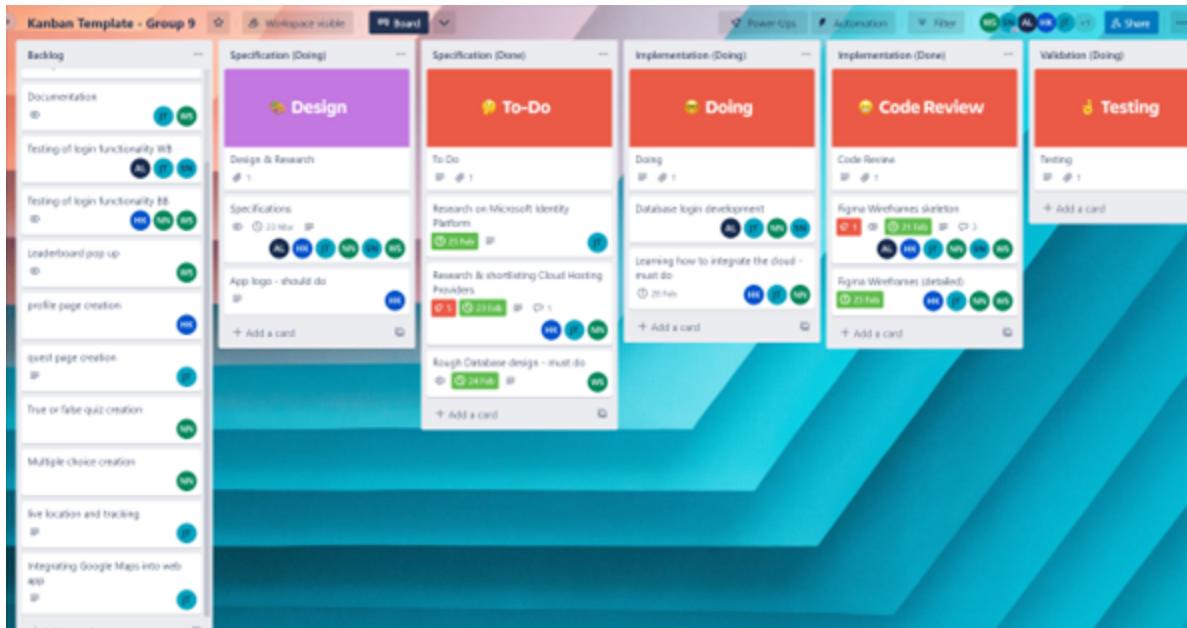

Kanban after our first meeting

170223

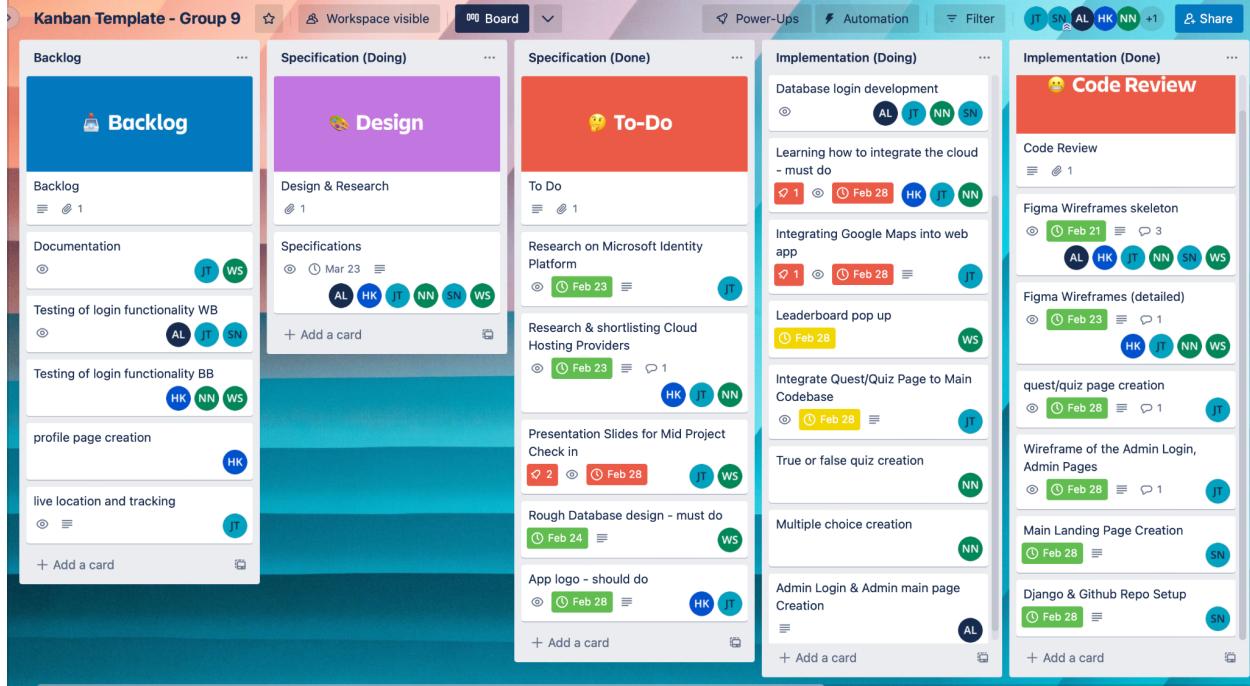

Kanban after our second meeting

230223

Kanban after our third meeting where we had an in depth discussion on our major features and started inputting tickets into the backlog.

280323

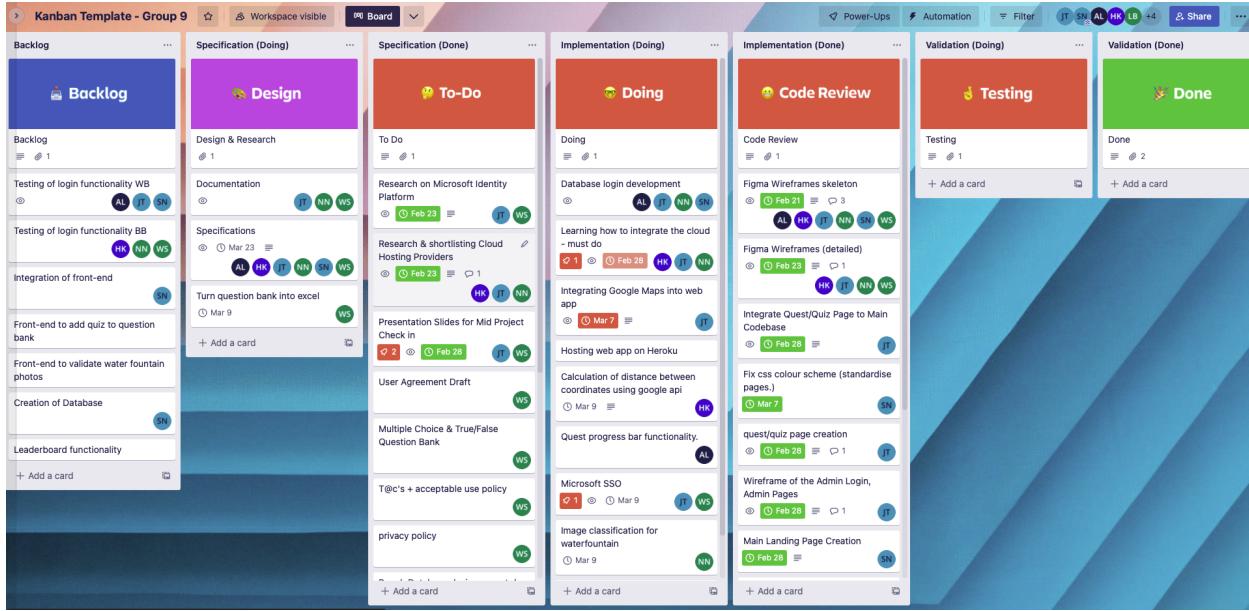

Kanban after our fourth meeting. Major progress with Figma wireframes and mockup complete. All the individual draft front-end completed by members. Each member took responsibility to complete a feature of the website.

010323

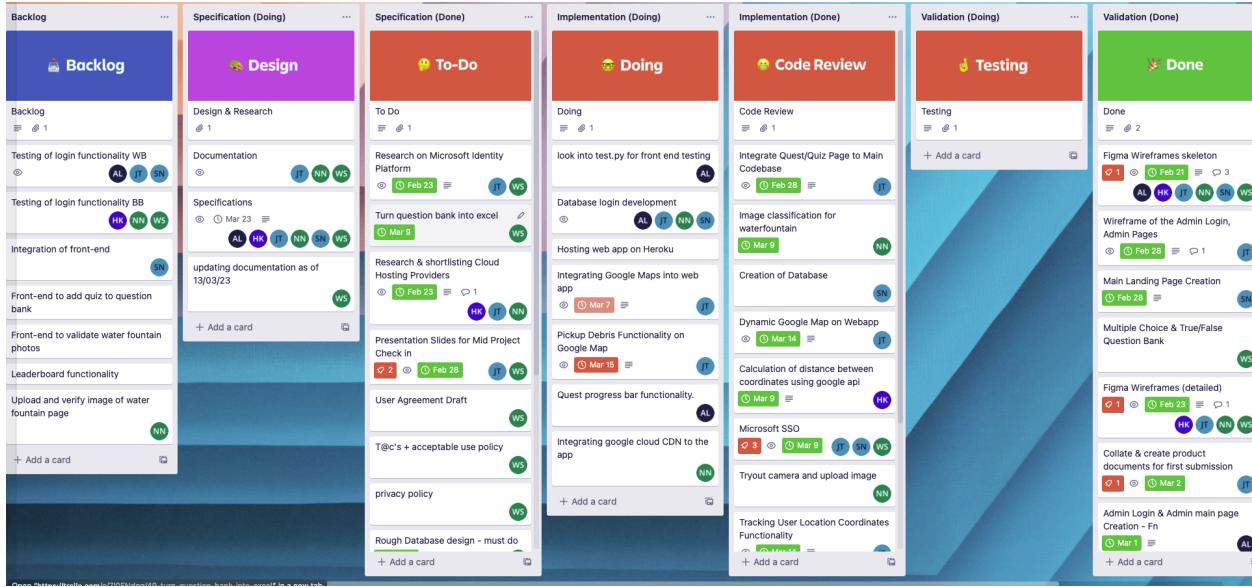

Kanban after our fifth meeting. Major progress with Backend design completed. Cloud platform selection complete. Currently integrating separate front-end features into the main codebase.

070323

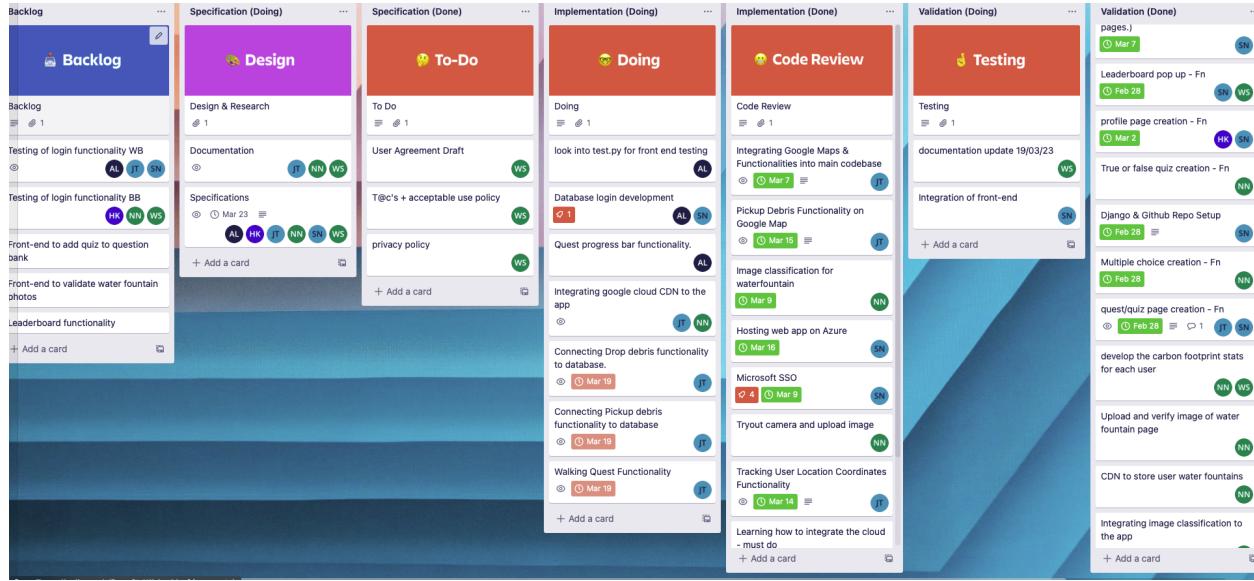

Our group has hit multiple blockers including but not limited to microsoft sso login integration, google map tracking, live location tracking, AI integration, database integration and calling data from the database. Pair programming and mob programming used to try and unblock blockers.

160323

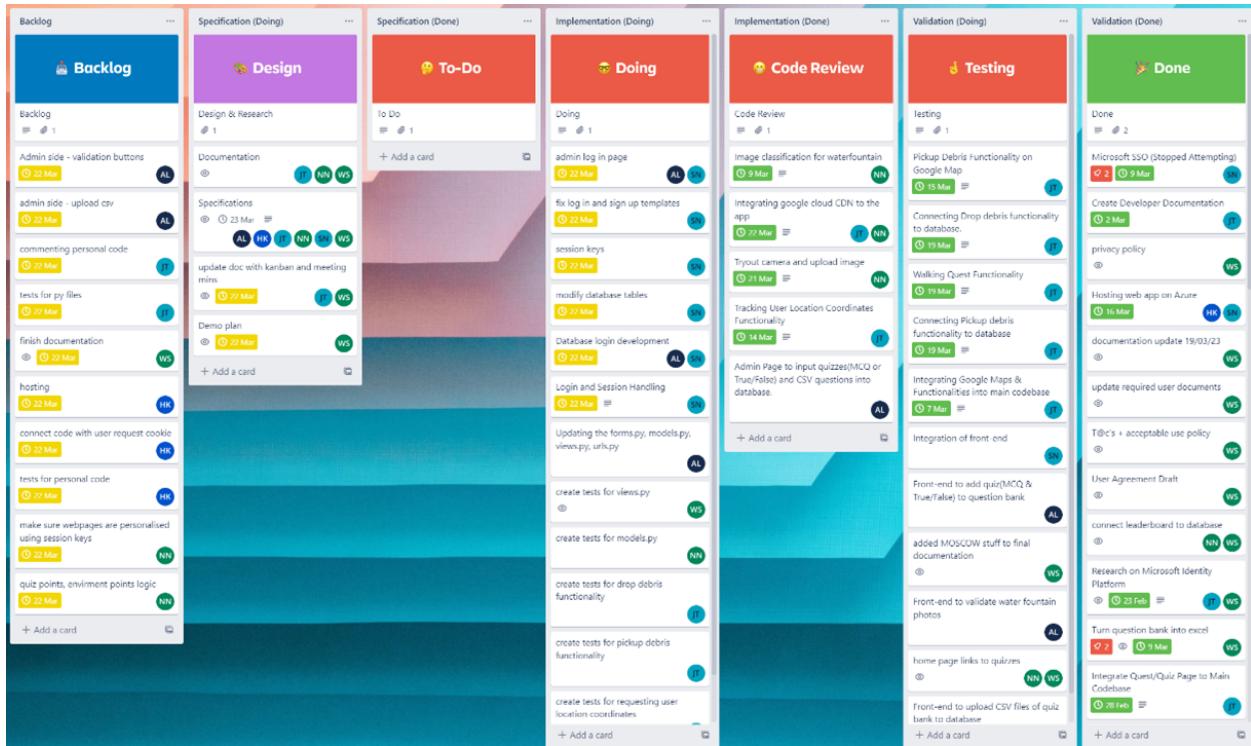

With a week till the deadline our group still had a lot to do but with our good chemistry we believed the task was possible and adding/moving stuff across our kanban fuelled the confidence seeing as we could watch as more and more stuff was moved across.

210323

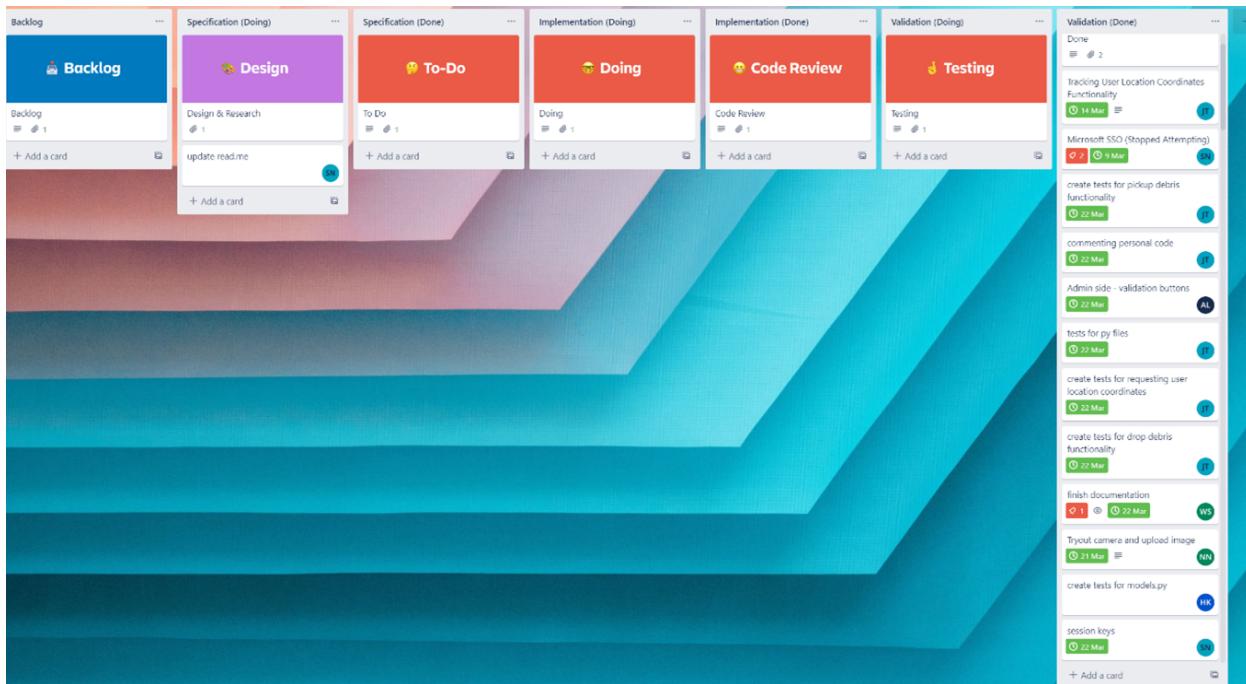

Heading into the final few days our Kanban board was progressing but with a lot still to do we were conscious time was running out but the board allowed us to keep on track and monitor our progress. We finally overcame multiple blockers with pair programming and mob programming proving very useful. Code was reused whenever possible and knowledge was constantly being shared amongst the team to help unblock blockers quickly, saving the team precious time.

220323

Start of the day we added everything we needed to do to the backlog and started moving what had been completed over to the validating done table in an attempt to start clearing our Kanban board. Tensions and stress levels were at an all time high but we stuck to using pair and mob programming to solve our issues. This allowed us to quickly progress and solve blockers.

230323

Completed the project and validated all implementation and documentation. Final checks and tests before submission.
